

The first three numbers here represent PG, VG, and the amount of nic in your base juice. The "base" is the stuff you mix in to add the nicotine. Note that if you change the PG amount, the VG amount changes to make 100% total – and vice-versa if you change the VG.

Target Nicotine Strength is what you vape. In this case I prefer 12mg juice, so that goes here.

Flavorings are just that – flavorings. The four boxes are the name of the flavor, how much PG is in the flavor, how much VG is in the flavor, and the percentage of flavor you want in the mix. Note that probably 90% of the time, you can change the flavors to 100% PG and you'll be at least close to correct for mixing purposes.

Amount to Make is how much juice you want to end up with.

Water/Vodka/PGA is used if you need to dilute your mix.

These two boxes work the same as the other PG/VG ones, except these represent the final PG/VG mix you want in your juice.

Remember to click the calculate button when you're done!
